

Private money on public chains.

Private stablecoin payments for people, teams and AI agents. Private by default, provable on demand.

THE PROBLEM

Every stablecoin payment is public.

Payroll

Pay a team in stablecoins and every salary is public, forever.

Suppliers and treasury

Who you pay, how much, and your runway are readable by anyone.

AI agents

An agent's wallet shows every tool it pays for, and its strategy.

Holdings

Every balance and stock position, with its size, is on the record.

Public wallets are a target list.

72

physical attacks on crypto holders in 2025, a record. Kidnapping was the most common.

\$713M

stolen from 80,000 people's personal wallets in 2025.

270M

address-poisoning attacks in two years, built from public payment history.

\$60M

taken from traders by bots that see their trades coming, in one year.

Every one starts the same way: your balance and your history are public.

WHY NOW

Businesses and agents now pay in stablecoins.

\$390B

in real stablecoin payments in 2025

2×

the year before

\$226B

of it business to business, 58% of the total

Tempo went live on 18 March 2026, Robinhood Chain on 1 July, Arc on 16 September. All public by default.

WHY NOW

Private stablecoins are growing, and still early.

\$2.1M → \$51M

stablecoins held privately in Railgun on Ethereum, January 2024 to October 2026

<0.1%

of the \$311B stablecoin supply

FinCEN withdrew its proposed mixer rule on 5 October 2026. GENIUS requires issuers to be able to freeze, and Gloam's design never stops them.

THE IDEA

A payment has one owner.
So nobody else needs a key.

SHARED SECRETS

Auctions, order books, lending

Someone must compute on many people's hidden data. FHE and MPC networks like Zama and Arcium use a committee that holds the keys.

PAYMENTS

One owner

The owner proves the payment on their own device with zero-knowledge proofs. Nobody else ever holds a key.

Breach a committee and everyone is exposed, past payments too. Breach one device and one person is.

HOW IT WORKS

One private balance you can pay from and prove from.

Add money

Stablecoins, ETH or Robinhood Chain stock tokens go into the vault. Your balance becomes private.

Pay privately

Send, run payroll or let an agent pay. Amounts and people stay hidden.

Prove what's needed

Show a bank, landlord or accountant one fact, and nothing else.

Proofs are made on your device, never on our servers.

BUILT TO BE TRUSTED

Private, not a mixer.

- ✓ Sanctions checks on every deposit and cash out
- ✓ Stablecoin issuer rules respected on Tempo
- ✓ Proofs for auditors, accountants and banks
- ✓ No admin withdraw: nobody can move your money
- ✓ Rule changes wait three days in public

COMPETITION

Who can see your payments

WHO	WHO HOLDS THE KEY	ON TEMPO OR ROBINHOOD CHAIN	PROOF FOR ONE READER	PAYROLL AND AGENTS
Zama (FHE)	A 13-node committee, one global key	Not found	Decryption rights	Not found
Arcium (MPC)	A node cluster	Not found (Solana)	Not found	Not found
Tempo Zones	The zone operator sees all	Tempo, limited preview	Not found	Not found
Helius Privacy	Its server sees your inputs	Not found (Solana)	Not found	Not found
Railgun	Only you	Not found (Ethereum)	Viewing keys, whole history	Not found
Gloam	Only you	Both, on testnet	Yes, with an expiry	Yes

"Not found" means not found in their public docs, October 2026.

COMPETITION

Where each one wins

Zama

Computing on shared data, like auctions and lending. Over \$170M raised.

Arcium

Private shared state on Solana.

Tempo Zones

Enterprises that want an operator in the loop.

Helius Privacy

Speed on weak phones, and reach on Solana.

Railgun

Years live, a public ceremony, external audits. About \$113M held.

Payy

Consumer users and a Visa card today. \$6M seed.

We found no other product on Tempo or Robinhood Chain that combines owner-only privacy, proofs for one reader, and payroll and agent rails.

WHAT'S NEW

Not new cryptography. A new building block.

Payroll total proof

Proves a run of up to 32 payments paid exactly a total, without showing who got what.

Proofs for one reader

Who it is for and when it expires are sealed into the proof. Anyone checks it in a browser, no wallet.

Private agent payments

A private method proposed for MPP, private x402, and an MCP server with spending limits.

Private payments you can prove. As far as our research found, these three are new.

Not new: the Zcash-lineage private pool and viewing keys. We build on them.

PRODUCT

Live on testnet at gloam.trade

Private balance

OUSD and PathUSD on Tempo.
USDG, ETH and stock tokens on
Robinhood Chain.

Private payments

Hidden amounts, request links, and a
relay that hides your wallet.

Payroll

Upload a CSV, pay the team, repeat it
monthly with a cap.

Proofs

Proof of funds, of payment, or of a
payroll total. Checked at /verify.

Agents

Pay over x402 and MPP, with caps
per payment and per day.

For builders

SDK, partner API and an MCP server
in the official registry.

TRACTION

First commit on 14 July 2026.

100+

tester applications in about three days

88+

Telegram members in two days, with Glim, our AI helper

4

npm packages: SDK, MCP server, MPP method, app starter

93

contract tests, two internal audits, fixes deployed

- Live on Tempo and Robinhood Chain testnets

- Live in the official MCP Registry

- Submitted to the Claude directory

- Applied to Cursor's marketplace

- First hire: Community and Operations Lead

RECOGNITION

“a product niche that will
expand a lot”

Competing

BUSINESS MODEL

We earn when private money moves.

PAYMENTS

0.1% in, 0.1% out

A fee on deposits and cash outs, from mainnet. Railgun charges 0.25% each way.

PAYROLL

A fee per payroll run

Then team plans for scheduled payroll, approvals and accountant proofs.

BUILDERS

Partner API and SDK usage

Wallets, apps and agents build on Gloam and set their own fee on top.

If 1% of business stablecoin payments moved through Gloam, that is about \$2.3B a year and roughly \$4.6M in fees. Railgun earned about \$4.3M in the last 12 months at 0.25%.

GO TO MARKET

Land with payroll. Grow from there.

01	Land	Private payroll for crypto teams, DAOs and startups paying in stablecoins on Tempo and Robinhood Chain.
02	Expand	All of their business payments, not just salaries.
03	Distribute	Through builders and agents: SDK, MCP, x402 and MPP.
04	Partner	With the chains: self-custody privacy for everyone Zones do not serve.
05	Community	Testers become users. Over 100 applied in three days.

ROADMAP

From testnet to mainnet

NOW

Live on two testnets

Stablecoin payments, payroll, proofs and agent payments. Stock tokens held and sent privately.

UNDERWAY

Private trading

A new engine for private trading, built for many people's orders at once.

MAINNET PATH

Ceremony and audit

A multi-party key ceremony and an external audit, then launch.

FOUNDER

Ships products, audits protocols.

Duke

Founder · @dukedotsol · iamduke.xyz

Frontend and Web3 builder since 2023.

Core member of Superteam Nigeria.

Builds payments and agents

Over 15 products shipped on Solana, Arc and Robinhood Chain, including Keryx, pay-per-call payments for AI agents, and Siren, a prediction market terminal.

Secures the money layer

Head of Audits at SMC Audits. Independent audit of Toly's Percolator, quoted by Anatoly Yakovenko. Author of Kensho, an open security playbook.

Wins in public

3 hackathon wins, 14 bounty wins, 3 Superteam Earn sidetracks.

Private by default. Provable on demand.

RAISING OUR PRE-SEED TO REACH MAINNET

Audit and ceremony

An external audit and a multi-party key ceremony.

Mainnet launch

Tempo and Robinhood Chain, with deposit caps.

First 50 customers

Teams running payroll and agents paying privately.
